## ROLLING GATES AND ROLLED COVERS **PORTOS**

▶ The Portos company offers three sizes of boxes for rolling gates and two for rolled covers depending on the size of the gate recess. The gate boxes allow free space under the ceiling and thus increase the garage usable area. The maximum available width of the gates is 4.5 m.

The standard equipment of the PORTOS rolling gate includes: a box (250 mm, 300 mm or 350 mm with a console), an aluminium profile (PA-52, PA-55 or PA-77) manufactured by our company in colors that perfectly match the tastes of our customers and aesthetically fit into the colors of the building. The gates also contain safety elements in the form of blocking brackets that prevent from lifting the curtain by unauthorized persons, and the inertia brake at the PA-77 profile which protects against uncontrolled dropping of the curtain in the case of drive failure.

It is possible to install a rolling gate with a glazed or ventilation profile which will allow the admission of light and air circulation. The company also offers drives for gates and a control system designed for them. Our gates comply with the requirements of European Standards.
